

# Prolog

An introduction,

By Sajjad Heydari

*[SajjadHeydari74\[at\]gmail\[dot\]com](mailto:SajjadHeydari74[at]gmail[dot]com)*

# Prolog...

is

- ▶ Lazy.
- ▶ Based on logical rules.

is not

- ▶ Like traditional programming languages (C/C++, Java, Python)
- ▶ A functional language, it doesn't have any function.
- ▶ A good calculator.

- constants
- Atoms
  - Numbers
  - Variables
  - Relations

# Term

# Terms → Atoms

- ▶ Start with lowercase letters
- ▶ Can contain `_`, lowercase or uppercase letters, numbers

Example:

```
prolog.  
this_is_an_atom.  
number9.
```

# Terms → Numbers

- ▶ Any real number.

Example:

9  
3.14  
1e2

# Terms→ Variables

- ▶ Start with uppercase letters or \_
- ▶ Can contain \_, lowercase or uppercase letters, numbers

Example:

- A
- \_var
- Var123

# Anonymous Variable

---

- ▶ The Prolog variable `_` (underscore) is a "don't-care" variable, which will match anything.

**Example:** `bad(Dog):-  
bites(Dog, _).`

# Terms → Relations

- ▶ Consists of a functor and n arguments.
- ▶ Functor must be an *atom*.
- ▶ Arguments must be a **Term**.

## Example:

```
fun(prolog).  
functor(A1,argument2,_,a_complex(argument)).
```

# Clauses

- Facts
- Rules
- Queries

# Clauses → Facts

- ▶ Any term ending with a dot(.) is a fact.
- ▶ The term is called the head.
- ▶ A fact is considered true once prolog has parsed it.

## Example:

prolog.

food(pizza).  
likes(sajjad, pizza)

# Clauses → Rules

- ▶ Consists of a head, neck and body.
- ▶ Head is a clause (usually with variables in it).
- ▶ Body is a comma separated list of goals.
- ▶ Read:
  - ▶ If Body then Head.

neck  
↓  
head :-  
body.

# Example

- ▶ Likes(Person, Thing):-
  - ▶ Food(Thing).

- ▶ is\_parent(Person\_A, Person\_B):-
  - ▶ father(Person\_A, Person\_B).
- ▶ is\_parent(Person\_A, Person\_B):-
  - ▶ mother(Person\_A, Person\_B).

} Procedure

# Example

- ▶ happy(Person):-
  - ▶ eats(Person, Food), ← and
  - ▶ likes(Person, Food).
- ▶ A *Person* is happy if he is eating *Food* and *he* likes the *Food*.

# Clauses → Queries 1

- ▶ List of one or more goals,
- ▶ Typed at prolog interpreter :-
- ▶ Comma separated.

**Example:** `?-like(sajjad,pizza).`

# Clauses → Queries 2

- ▶ If a query doesn't have any variable,
  - ▶ Prolog answers with true/false
- ▶ If the query includes variables,
  - ▶ Prolog tries to find all bounds of that variable that make the statement true.
    - ▶ You can get the next one by typing ;

## Example:

```
?-like(sajjad,pizza).  
true
```

```
?-like(sajjad,X).  
X = pizza;  
X = burger;  
true.
```

Pressed ;

# Special Commands

# Negation

► `not(X).`

# Write

- ▶ `write("String").`
- ▶ `write(term).`

# New Line

► nl.

# Trace

- ▶ `trace.`
- ▶ `notrace.`

# Exit

► halt.

# Load

- ▶ [file]
- ▶ Loads 'file.pl'

# Comment

- ▶ %Comment
- ▶ /\*Multi lined Comment \*/

# Family Tree

# Mother / Father

- ▶ `mother(Person_a, Person_b):-`
  - ▶ `parent(Person_a, Person_b),`
  - ▶ `female(Person_a).`
- ▶ `father(Person_a, Person_b):-`
  - ▶ `parent(Person_a, Person_b),`
  - ▶ `male(Person_a).`

# Ancestor

- ▶ `ancestor(Person_a, Person_b):-`
  - ▶ `parent(Person_a, Person_b).`
- ▶ `ancestor(Person_a, Person_b):-`
  - ▶ `parent(Person_a, Person_c),`
  - ▶ `ancestor(Person_c, person_b).`

# Crossword Puzzle

- Fill the crossword with the following words:
  - abalone, abandon, anagram, connect, elegant, enhance

# Describing words in prolog

- ▶ `word(abalone, a, b, a, l, o, n, e).`
- ▶ `word(abandon, a, b, a, n, d, o, n).`
- ▶ `word(anagram, a, n, a, g, r, a, m).`
- ▶ `word(connect, c, o, n, n, e, c, t).`
- ▶ `word(elegant, e, l, e, g, a, n, t).`
- ▶ `word(enhance, e, n, h, a, n, c, e).`

# Describing Crossword

- ▶ crossword(H1, H2, H3, V1, V2, V3):-
  - ▶ word(H1, \_, A11, \_, A12, \_, A13, \_),
  - ▶ word(H2, \_, A21, \_, A22, \_, A23, \_),
  - ▶ word(H3, \_, A31, \_, A32, \_, A33, \_),
  - ▶ word(V1, \_, A11, \_, A21, \_, A31, \_),
  - ▶ word(V2, \_, A12, \_, A22, \_, A32, \_),
  - ▶ word(V3, \_, A13, \_, A23, \_, A33, \_).

	V1	V2	V3
H1	A11	A12	A13
H2	A21	A22	A23
H3	A31	A32	A33

# Query

▶ ?-crossword(H1, H2, H3, V1, V2, V3).

- ▶ H1 = abalone,
- ▶ H2 = anagram,
- ▶ H3 = connect,
- ▶ V1 = abandon,
- ▶ V2 = elegant,
- ▶ V3 = enhance ;

- ▶ H1 = abandon,
- ▶ H2 = elegant,
- ▶ H3 = enhance,
- ▶ V1 = abalone,
- ▶ V2 = anagram,
- ▶ V3 = connect ;

- ▶ false.

# List

- ▶ A comma-separated sequence of items, between square brackets.
- ▶ Similar to arrays.

Example:

- [ ] ← Empty List
- [1, 2, 3]
- [sajjad, [a,b], term\_ex(1, foo) ]

# List [H | T]

- ▶ A list could be represented as Head and Tail.
- ▶ Head is the first element.
- ▶ Tail is a list.

Example:  $[1, 2, 3] = [1 \mid [2, 3]]$

# List $[H \mid T]$ , (cont.)

- ▶ Head could be a series of items.
- ▶  $[a, b \mid T]$
- ▶  $[a, b, c \mid T]$
- ▶  $[a, b, c, d \mid T]$

**Example:**  $[1, 2, 3, 4, 5] = [1, 2 \mid [3, 4, 5]]$

# Member

- ▶ `member(X, [X|T]).`
- ▶ `member(X, [_|T]):-`
  - ▶ `member(X, T).`

Anonymous Variable

# Appending

Ex: `append( [1, 2, 3], [4, 5] , [1, 2, 3, 4, 5]) .`

# Appending → Rules

- ▶ `append([], L, L).`
- ▶ `append( [H | T] , L2, [H | L3] ):-`
  - ▶ `append(T, L2, L3).`

# Appending → Query

- ▶ `?-append([1, 2, 3, 4] , [5, 6], X).`
- ▶ `X = [1, 2, 3, 4, 5, 6].`

# Prefix

- ▶ `prefix(S,L):-`
  - ▶ `append(S, _, L).`

# Suffix

- ▶ `suffix(S, L):-`
  - ▶ `append(_, S, L).`

# Reversing

Ex: reverse( [1,2,3,4], [4,3,2,1]).

# Reversing → Rules

- ▶ `reverse( [ ], A, A).`
- ▶ `reverse( [H | T], A, R) :-`
  - ▶ `reverse( T, [H | A], R).`
- ▶ `reverse( A, R):-`
  - ▶ `reverse( A, [], R).`

# Reversing $\rightarrow$ Query

- ▶ ?- reverse([1,2,3,4], X).
- ▶ X = [4, 3, 2, 1].

Prolog	Description
<code>a is b.</code>	<code>a = b</code>
<code>a + b</code>	<code>a + b</code>
<code>a - b</code>	<code>a - b</code>
<code>a * b</code>	<code>a x b</code>
<code>a / b</code>	<code>a / b</code>
<code>mod(a, b)</code>	<code>a mod b</code>
<code>a &gt; b.</code>	<code>a &gt; b</code>
<code>a &lt; b.</code>	<code>a &lt; b</code>
<code>a &gt;= b</code>	<code>a &gt;= b</code>
<code>a &lt;= b</code>	<code>a &lt;= b</code>
<code>a := b</code>	<code>a = b</code>
<code>a /= b</code>	<code>a != b</code>

is vs. = vs. ==

	'is'	=	==
On left	Expression	Term	Expression
On Right	Variable or Number	Term	Expression
Action	Evaluate right, compare with left	Compares the terms (doesn't evaluate)	Evaluates and compare

Expressions can not  
contain Variables!

# Example

- ▶ 3 is  $2 + 1$ . Correct
- ▶  $2+1$  is 3. Error
- ▶ X is  $2 + 1$ . Correct ( $X = 3$ )
- ▶  $3 = 2 + 1$ . Error
- ▶  $2 + 1 = 2 + 1$ . Correct
- ▶  $1 + 2 = 2 + 1$ . Error
- ▶  $X + 2 = 1 + 2$ . Error
- ▶  $2 + 1 ::= 1 + 2$ . Correct
- ▶  $X + 2 ::= 1 + 2$ . Error

# Length

► Len( [a,b,c], 3).

# Length $\rightarrow$ Rules

- ▶ `len([], 0).`
- ▶ `len([H|T], X) :-`
  - ▶ `len(T, A),`
  - ▶ `X is A + 1.`

# Length → Queries

- ▶ `?- len([A,B], X).`
- ▶ `X = 2.`
- ▶ `?- len([1,2,3],4).`
- ▶ `false.`

# Monkey and Banana

- ▶ A Monkey is on the floor.
- ▶ There is a banana on the ceiling, beyond reach of the monkey.
- ▶ There is a box in the corner.
- ▶ Can the monkey eat the banana?

# M&B → State

- ▶ State( Monkey\_X, Monkey\_Y, Box\_position, Has\_banana)
- ▶ Monkey\_x: door, middle, corner
- ▶ Monkey\_y: on\_floor, on\_box
- ▶ Box\_position: door, middle, corner
- ▶ Has\_banana: yes, no

# M&B → Transition → Grasp

- ▶ move(  
▶ state(middle, on\_box, middle, no),  
▶ grasp,  
▶ state(middle, on\_box, middle, yes)  
▶ ).

# M&B $\rightarrow$ Transition $\rightarrow$ Climb

- ▶ move(  
▶ state(X, on\_floor, X, Has),  
▶ climb,  
▶ state(X, on\_box, X, Has)  
▶ ).

# M&B → Transition → Push

- ▶ move(  
▶ state(X, on\_floor, X, Has),  
▶ push,  
▶ state(X2, on\_floor, X2, Has)  
▶ ).

# M&B → Transition → Walk

- ▶ move(  
▶ state(\_, on\_floor, Y, Has),  
▶ walk,  
▶ state(\_, on\_floor, Y, Has)  
▶ ).

# M&B → Transition → canget

- ▶ `canget(state(_,_,_,yes)):-`
- ▶ `write("get"),nl.`

# M&B → Transition → canget (cont.)

- ▶ canget(State1) :-
- ▶ move(State1, Move, State2),
- ▶ canget(State2),
- ▶ write(State2), nl,
- ▶ write(Move), nl.

# M&B → Query

- ▶ `canget(state(door, on_floor, corner, no)).`
- ▶ `get`
- ▶ `state(middle,on_box,middle,yes)`
- ▶ `grasp`
- ▶ `state(middle,on_box,middle,no)`
- ▶ `climb`
- ▶ `state(middle,on_floor,middle,no)`
- ▶ `push`
- ▶ `state(corner,on_floor,corner,no)`
- ▶ `walk`
- ▶ `true .`

# Prolog

An introduction,

By Sajjad Heydari
